

# Contents

	Symbols	1
1	Introduction	3
2	Background	4
2.1	Code's prescriptive approach for ensuring the durability of concrete structures with respect to chloride-induced corrosion	4
2.2	Performance-based probabilistic service-life design of concrete structures for chloride-induced corrosion	6
2.2.1	Principle	6
2.2.2	Mathematical model for chloride penetration in concrete	7
2.2.3	Methodology for prediction of a condition state ( <i>a priori</i> )	15
2.2.4	Model parameters and data used for the benchmark task	17
3	Benchmarking	32
3.1	Selection of countries	32
3.2	Deemed-to-satisfy rules of the selected countries	35
3.3	Prediction of condition state ( <i>a priori</i> )	39
3.3.1	Procedure	39
3.3.2	Reliability spectra ( <i>a priori</i> )	44
3.4	Verification by assessing existing structures ( <i>a posteriori</i> )	47
3.4.1	Methodology	47
3.4.2	Data from practical investigations	49
3.4.3	Verification of the model prediction	50
3.4.4	Verification of the <i>a priori</i> reliability spectra	53
4	Proposal for performance-based deemed-to-satisfy rules	56
