

# Contents

1	Introduction	1
1.1	Scope of the document	1
1.2	Mechanically excavated tunnels	1
1.3	Fibre reinforced concrete in segmental lining tunnels	3
1.4	References	7
2	Material	8
3	Design for transient load situations during production	12
3.1	Transient load situations	12
3.2	Safety format and design strategies	13
3.3	Criteria for replacing steel bars with fibres	14
3.4	Design procedure according to Limit States Approach	14
3.4.1	Introduction	14
3.4.2	Reinforcement design by means of sectional analysis	15
3.4.2.1	Assessment of $M_{cr,d}$	15
3.4.2.2	Assessment of the required $f_{R3k}$ for a specific $M_d$	16
3.4.3	R/FRC segments with $M_u \geq M_{cr,d}$	17
3.4.4	FRC segments with $M_u \geq M_{cr,d}$	18
3.4.5	FRC segments with $M_u < M_{cr,d}$	18
3.5	Cracking service limit state	19
3.6	Design for different loading stages	20
3.6.1	Demoulding	20
3.6.2	Stacking	21
3.6.3	Transportation	22
3.6.4	Handling	23
3.7	References	24
4	TBM Thrust phase	26
4.1	Local segment behaviour	27
4.1.1	Local segment behaviour of FRC tunnel segments	32
4.2	Global segment behaviour	35
4.2.1	Global segment behaviour of FRC tunnel segments	39
4.3	References	41

5	Final state loading condition	44
6	Evaluation of tunnel linings under fire exposure	46
6.1	Introduction	46
6.2	Degradation of the material properties	46
7	Connectors	50
7.1	Introduction	50
7.2	Types of connectors	50
7.3	Use of connectors	50
7.4	Loads and failure modes for inserts in concrete	52
7.5	Design of connectors	52
7.5.1	Design against steel rupture	53
7.5.2	Design for loss of interface bearing in sockets	54
7.5.3	Design for concrete failure on the basis of the Concrete Capacity Design Method (CCD)	54
7.5.4	Extreme and long – term loading conditions	56
7.5.5	Design combinations and safety concept	56
7.5.6	Load bearing capacity verification	57
7.6	References	58
8	Durability	60
8.1	Introduction	60
8.2	Existing standards and guidelines	60
8.3	Corrosion of steel fibres	62
8.3.1	Corrosion in uncracked concrete	62
8.3.2	Corrosion in cracked concrete	65
8.4	Stray-current induced fibre corrosion	73
8.5	Summary	74
8.6	References	75
9	Quality control	78
9.1	Initial tests, trials	78
9.1.1	Assessment of concrete properties at 28 days	78
9.1.2	Assessment of concrete properties at early age	81
9.1.3	Assessment of concrete properties in the long term	81
9.1.4	Further tests	82
9.2	Tests during production	83
9.3	Acceptance criteria	84
9.4	References	84

10	The sustainability assessment of tunnel linings through the combined use of EMI and MIVES methods	85
10.1	Sustainability Index	86
10.1.1	Method for defining the value function	88
10.2	Mechanical Index	92
10.3	Application to a concrete lining	95
10.4	Conclusions	100
10.5	References	101
11	Case studies	103
11.1	Case Study 1	103
11.2	Case Study 2	120
	Appendix 1: Definition of M-N envelopes at ULS	133
	Appendix 2: Definition of M-N envelopes at SLS	138
	Appendix 3: Stress-strain relationship for Non Linear analysis	144
	References	161
